Putting the system online (about 20 minutes, once)

The dashboard runs on Streamlit Community Cloud; the watcher runs on GitHub Actions every 3 hours. Both are free for a public repository. Your laptop is no longer needed.

Part A: GitHub (code, data and the 3-hourly watcher)

1. Create a free account at https://github.com
2. Click **New repository**. Name: `ebola-ai-system`. Choose **Public**. Click **Create repository**.
3. On the next page click **uploading an existing file**. Open your `ebola_ai_system` folder, select **everything inside it** (including the `.github` and `.streamlit` folders) and drag it onto the page. Wait for the upload to finish, then click **Commit changes**.
4. **Settings > Secrets and variables > Actions > New repository secret** Name: `ANTHROPIC_API_KEY` Secret: your API key. Click **Add secret**.
5. **Settings > Actions > General > Workflow permissions**: choose **Read and write permissions**, **Save**.
6. **Actions** tab > **Update outbreak data** > **Run workflow** > **Run workflow**. The first run takes 5-10 minutes (it fills in the daily history). A green tick means it worked. After that it runs by itself every 3 hours.

Part B: Streamlit Community Cloud (the dashboard)

7. Go to https://share.streamlit.io and click **Continue with GitHub**; allow access.
8. Click **Create app > Deploy a public app from GitHub**. Repository: `<your-username>/ebola-ai-system` Branch: `main` Main file path: `dashboard.py` App URL: choose a name, e.g. `kenya-ebola-analytics`
9. Click **Advanced settings**. Python version: **3.11**. In **Secrets** paste (with your own values): ANTHROPIC_API_KEY = "your-api-key" SITREP_PASSWORD = "choose-a-password" Click **Save**, then **Deploy**.

Your links: - Live dashboard: https://kenya-ebola-analytics.streamlit.app - Colloquium replay: https://kenya-ebola-analytics.streamlit.app/?view=replay

Part C: on your laptop

10. Double-click **Stop automatic updates.bat**, so that only the online system updates the data.

Before the colloquium

- Open both links 10 minutes before you start: an app that has not been used for a while sleeps, and takes about a minute to wake up.
- The AI situation report asks for the password you set in step 9.
